Question 1

Difficulty: Beginner

What is the difference between let, const, and var in JavaScript?

var has function scope and allows redeclaration, which can lead to unexpected bugs.

let has block scope and allows reassignment but not redeclaration in the same scope.

const also has block scope but does not allow reassignment after declaration.

In modern **JavaScript**, let and const are preferred because they provide better scope control and help avoid errors.

```
[js]
let count = 10;
count = 20; // valid, reassignment allowed
const name = "Aaftab";
// name = "Ali"; // Error: reassignment not allowed
var age = 25;
var age = 30; // valid, redeclaration allowed
```

Question 2

Difficulty: Intermediate

What is the difference between synchronous and asynchronous JavaScript?

Synchronous JavaScript executes code line by line and blocks execution until a task is completed.

Asynchronous JavaScript allows long running tasks like API calls or timers to run in the background without blocking the main thread.

Asynchronous behavior is handled using callbacks, promises, and async/await.

```
[js]
console.log("Start");
setTimeout(() => {
  console.log("Async Task");
}, 1000);
console.log("End");
```
